

# Winter workplace pest

“Rodent season” – as known in the industry – is here. Just like you and I, rats and mice are looking to be nice and warm, unfortunately this means moving indoor.

Our properties make perfect nesting grounds as there is plenty of food, water and some buildings now come with insulation. Along with the cooler climate, rain and changes in land development are driving rodents into our properties.

The obvious signs of a rodent infestation in your property are if you see droppings or hear scratching in the walls/roof. This is potentially harmful for you and your staff as rodents:

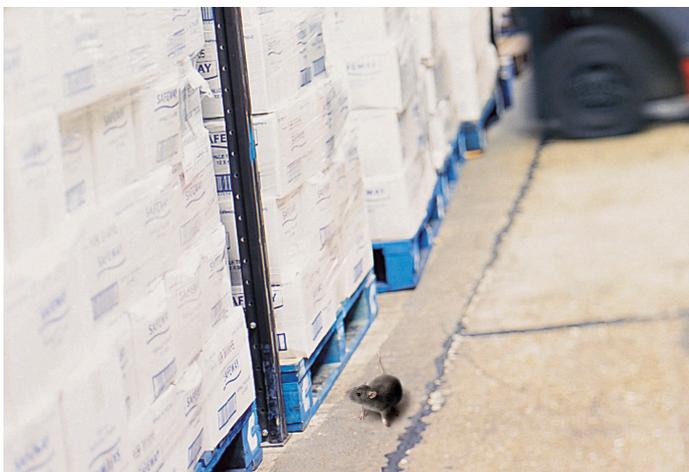

- Eat through the sarking in a roof void
- Nest in and around insulation batts
- Gnaw on electrical wires, leaving them exposed and potentially causing fires

Our technicians are fully trained to handle rodent infestations. We will assess the property and draw your attention to the signs of a rodent infestation. We will then determine the level of activity and the damage that has already been caused. Flick Anticimex offers numerous tamper-proof rodent bait stations

that can be placed around the exterior of your property, preferably in areas where rodent activity has been most rampant.

We also offer our toxic-free rodent solution, SMART, a combination of high-tech digital traps, sensors and cameras to help control rodent activity. Combining our experience and knowledge of rodents with an array of advanced equipment we can ensure an effective prevention programme that is tailored to every customer’s specific business needs.

Rodent numbers have been known to grow if left untreated. If you have or suspect you have a problem with rodents, give us a call at 13 14 40. If you would like to know more about our SMART technology, feel free to call us at 1300 148 440 or visit our [SMART](#) page.

## Why should you consider using SMART?

- 24/7 and real time monitoring.
- Enables pre-emptive action, preventing future outbreaks.
- Cost-effective as a result of reduced risks and less internal checks.
- Free from pesticides.
- Proactive action on areas of high rodent detections leading to more effective control before infestation becomes critical (Preventative Rodent Monitoring).
